New Pregnancy Packet

Evergreen Health
OBSTETRICS & GYNECOLOGY CARE, TAN
GROUP PRACTICE

The physician you choose will be your primary obstetrician and you will see her for the majority of your OB visits. Occasionally, you may see a nurse practitioner. After normal business hours, the call schedule rotation is split evenly between our five physicians. During working hours, you are typically attended to by your physician. Our physicians do not share call with other physicians outside of the practice. Odds are, you will be delivered by your physician, but it depends on when your baby decides to arrive! The timing of OB visits is detailed in a separate handout contained in the OB folder you receive at your first appointment.

INITIAL APPOINTMENT

At your first appointment, you will meet with a nurse practitioner for a physical exam, ultrasound if indicated, and to discuss any concerns or questions you may have. You will also have a Pap smear if you are due. At the conclusion of your appointment, blood tests are run to determine RH and blood type, Rubella (measles) immunity, blood count and thyroid condition. We also test for bladder infection, Syphilis, Hepatitis, Gonorrhea, Chlamydia, and HIV. If Pap smear and blood tests are normal, we do not call or send a letter. If there is anything that needs to be addressed or treated, you will receive a phone call within 5-7 days.

SUBSEQUENT VISITS

Your next OB appointment is typically at 12 weeks. This may include an ultrasound and blood test to check for increased risk of specific types of birth defects. If you opted not to have this done, an ultrasound is not necessary. Instead, we will be able to hear the fetus’s heart beat using a Doppler. You will see your physician, who will review your initial OB labs and address any questions you may have. A routine ultrasound is also done around 20 weeks to check placental placement and fetal anatomy. This is likely the last ultrasound you will have, but this depends on individual needs. A more detailed list of appointments is located in the OB patient folder.

QUESTIONS AND CONCERNS

You will most likely have questions or concerns that arise between your OB visits. We have a nurse available during business hours to address concerns and speak with your physician if needed. She may be reached by calling the main office line at (425) 285-0060. Choose the option to leave a message for the nurse. Leave a phone number where you can be reached, make sure to slowly spell your first and last name. If it is an urgent concern that cannot wait for a call back, speak to the receptionist, who will connect you with the nurse. If it is after hours and cannot wait for the next day, you may reach the physician on call by choosing the appropriate option on the voicemail. If it is a life-threatening emergency, please call 911.

**BMI & Weight Gain Pregnancy**

**Please note:** Gaining more than the recommended amount during pregnancy increases your risk for cesarean section, diabetes and a large baby. Also, it may be more difficult to lose the weight after baby is born, and these excess pounds increase your lifelong health risks.

Strategies for Coping with Nausea

- Ginger Ale, Ginger tea, Ginger Snaps, Ginger Capsules
- Eat small frequent meals
- Eat protein/carbohydrate before you get out of bed in the morning. (Peanut butter/crackers on the bedside table) Getting food in your stomach before you start moving around can help get the day off to a good start.
- Try sniffing a lemon, drinking lemonade, sucking on a lemon drop.
- Potato chips and day old popcorn help.
- Try hard peppermint candy. Put peppermint oil on your wrist pulse point- sniff when nauseated.
- Emetrol is a non-prescription medicine that can be bought at the pharmacy for nausea and can be effective.
- Another is Cola Syrup.
- Try taking Vitamin B6, 50mg, twice a day in addition to your prenatal vitamin.
- You can also take ½ of a Unisom tablet twice a day. Unisom is an over the counter sleeping preparation that is OKAY in pregnancy, and can help with nausea. (Make sure active ingredient is Doxylamine Succinate.)
- Two Flinestone’s vitamins equal one prenatal vitamin if you cannot tolerate your prenatal vitamin take one in the morning and one at night.
- Try new surroundings, take a walk outside, do something different.

YOU SHOULD URINATE AT LEAST 3-4 TIMES PER DAY. LESS THAN THIS MEANS YOU MIGHT BE DEHYDRATED. DEHYDRATION CAN ALSO CAUSE NAUSEA, VOMITING AND STOMACH CRAMPS. CONTACT THE CLINIC IF YOU ARE UNABLE TO KEEP DOWN LIQUIDS FOR 24 HOURS OR UNABLE TO URINATE.

IF YOU HAVE TO CHOOSE BETWEEN SOLID FOODS AND LIQUIDS- CHOOSE LIQUIDS TO KEEP FROM GETTING DEHYDRATED. YOUR BODY HAS RESOURCES TO PROTECT THE BABY DURING EARLY PREGNANCY NAUSEA AND VOMITING.
INSTRUCTIONS FOR NAUSEA COMBO MEDICATION

THESE MEDICATIONS ARE SIMILAR TO A PRESCRIPTION COMBINATION. TAKE THEM EVERY DAY, AT LEAST THE BEDTIME DOSE, TO PREVENT NAUSEA.

Vitamin B6 (pyridoxine) - 25 mg tablets
Unisom (doxylamine) - 25 mg tablets

Note: The doxylamine may make you sleepy.

EVENINGS/BEDTIME: Take one tablet of both the B6 and Unisom.
MORNINGS: Take ½ of both B6 and Unisom, as needed.
MID-DAY: Take ½ of both B6 and Unisom, as needed.
Safe Medications to Use in Pregnancy

The following over-the-counter medications and home remedies have no known harmful effects during pregnancy when taken according to package directions. Please note that no drug can be considered 100% safe to use during pregnancy. If you want to know about the safety of any other medications not listed here, please contact your health care provider.

**PLEASE FOLLOW ADULT RECOMMENDED DOSING ON MEDICATION**

Information you should know during pregnancy

Alcohol
The harmful effects of alcohol consumption during pregnancy are well-known and include physical defects, learning disabilities, and emotional problems in children. Experts haven’t yet defined a safe level of alcohol for women who are pregnant, nor do they know whether or how babies differ in their sensitivity or reaction to alcohol. Although you shouldn’t worry about alcohol you drank before you found out you were pregnant, you should abstain from any further consumption and avoid all alcoholic beverages. Let your healthcare provider know if you are finding it difficult to stop drinking alcohol. Another good resource is Lakeside-Milam Recovery Centers, which offer evaluation and treatment for alcohol addiction. You may contact them or get a listing of locations at 1-800-231-4303, (425) 823-3116, or www.lakesidemilam.com.

Tobacco
When you smoke, the placenta is deprived of nutrients and oxygen, which means that less of these get to the developing fetus. Babies born to mothers who smoke are more likely to be low birth weight and have health problems such as poor lung function. Smoking can also lead to pre-term labor and an increased risk of placenta previa, or when the placenta covers the opening to the uterus. If you need assistance with quitting smoking, please let your healthcare provider know. Nicotine replacement patches and medications such as Wellbutrin are approved to use during pregnancy and are preferable to smoking.

Illegal Drugs
Using drugs such as marijuana, heroin, cocaine, and meth during pregnancy has adverse effects on the developing fetus and newborn. These drugs cross the placenta and enter the fetal blood stream. Use of these drugs can affect central nervous system functioning and can lead to premature delivery, growth retardation, withdrawal symptoms in the newborn, behavioral problems, or even stillbirth. If you use illegal drugs, please notify your healthcare provider so that we may help you. Lakeside-Milam Recovery Centers may also provide assistance with drug addiction (please see contact information above under “Alcohol”).

Diet
If you were eating a well-balanced diet before pregnancy, chances are you will not need to make big changes. Make sure that you are getting food from the five healthy food groups: grains, protein, fruits, vegetables, and milk products. Emphasize whole wheat bread products and brown rice in place of simple/refined carbohydrates, such as white bread, white rice, refined cereal, cookies, etc. In addition, try to limit extra sugar and fat. Drink plenty of water, 6-8 glasses a day. It is also recommended that you continue to take your prenatal vitamin daily throughout pregnancy and breastfeeding. Foods to avoid in pregnancy are raw eggs, unpasteurized dairy products, and undercooked meat. Certain types of fish should not be eaten more than once a week, including canned tuna, mahi mahi, halibut, pollack, and cod. Tuna steaks, shark, swordfish, tile fish, and sea bass should not be consumed. All other types of seafood are safe to eat.
Weight Gain
Weight should be gained slowly and steadily, and varies from woman to woman. The average weight gain during pregnancy is 25-40 pounds. Talk to your health care provider if you have questions regarding your individual goal weight gain.

Exercise
Exercise is encouraged during pregnancy. Most types of exercise are safe, but you should avoid activities that increase your risk of falls or injury. Walking, swimming, and yoga are great forms of exercise during pregnancy. After the first five months, it is best to avoid lying flat on your back, as the baby’s weight can interfere with blood circulation. Make sure to stay well-hydrated and stop exercising if you notice shortness of breath, dizziness, blurry vision, chest pain, or severe abdominal or pelvic pain.

Caffeine
Most researchers agree that, although caffeine does cross the placenta, moderate amounts (about 300 mg a day) will not hurt your baby. This represents about two 8-ounce cups of coffee, two shots of espresso, or two caffeinated sodas daily. Keep in mind the serving size of your mug or cup (typically around 12-16 oz)!

Intercourse
In most cases, intercourse throughout the pregnancy is fine. Intercourse will not cause a miscarriage. Miscarriages that occur commonly do so as a result of a chromosomal abnormality or other problem with the developing fetus, not from anything you do or don’t do. Intercourse will not harm the fetus. It is well protected by the abdomen, amniotic fluid, and cervical mucus plug, which prevents semen and bacteria from entering the uterus. Orgasms can cause contractions; however, most research indicates that if you have a normal pregnancy, orgasm—with or without intercourse—does not lead to premature labor or birth. If certain problems are present, your provider may ask you to stop having intercourse. If you have a new sexual partner during your pregnancy, please use condoms to prevent sexually transmitted diseases.

Safety
Always wear a seatbelt when driving or riding in a vehicle. Avoid activities that may cause injury or falls. Avoid completely immersing yourself in hot tubs. Seek other medical or dental care when needed, but make sure providers know you are pregnant. If you do not feel safe at home with your partner, please let your health care provider know immediately so that we may be of assistance.
COMMON 1st TRIMESTER SYMPTOMS

**Nausea**
This can occur at any time of day and may come in the form of aversion to certain foods. It generally improves by the 13th or 14th week of pregnancy, but can continue into the 2nd trimester. Munch a few crackers before getting up in the morning, eat several small meals a day so that your stomach is never empty, drink plenty of liquids, try wearing a motion sickness band or ginger soda, tea, or capsules.

**Heartburn**
May be an effect of sluggish digestion or the expansion of the uterus. Eat several small meals a day instead of three large ones, avoid triggers (fried foods, chocolate, peppermint, garlic, onion), drink plenty of fluids, and stay up for 2-3 hours after your evening meal. Antacids (Tums, Mylanta, Maalox) and medications such as Zantac or Tagamet are fine to take for relief.

**Constipation**
Constipation affects at least half of all pregnant women and is caused by an increase in progesterone, which slows the digestive process. Try to eat on a regular schedule, drink plenty of fluids, get some exercise daily, eat high-fiber fruits, vegetables, and grains, try fiber supplements (Metamucil, Citrucel) or a mild laxative (such as milk of magnesia).

**Dizziness**
Pregnancy causes dilation of blood vessels, resulting in lower blood pressure. Dizziness may also be caused by low blood sugar or anemia. We will do lab work to rule these conditions out. Get up slowly from lying or sitting down, walk at a slower pace, avoid prolonged standing, guard against over-heating (hot tubs, saunas), stay physically active, drink plenty of fluids, eat iron-rich foods (beans, red meat, green leafy vegetables, dried fruits).

**Fatigue**
Caused by demands on the circulatory system and increased progesterone, which makes you sleepy. Take naps during the day or go to sleep earlier, avoid taking on extra responsibilities, ask for support when you need it, exercise regularly, eat foods rich in iron and protein, avoid excess caffeine.

**Vaginal discharge and vaginal infections**
An increase in vaginal discharge is common in pregnancy due to increase in the turnover of vaginal lining cells. It will likely be present throughout the pregnancy. Let someone know if discharge becomes odorous, irritating, itchy, or discolored, or if you are having pain with urination.

**Headaches**
Headaches are one of the most common discomforts experienced during pregnancy. During the first trimester your body experiences a surge of hormones and an increase in blood volume. Stress, low blood sugar, lack of sleep, dehydration, caffeine withdraw can also be the cause. Apply cold compress to base of neck, maintain your blood sugar eating smaller more frequent meals, get plenty of sleep, rest in a dark room, having small amount of caffeine, taking Acetaminophen, avoiding Ibuprofen unless instructed by your physician.
COMMON 2nd and 3rd TRIMESTER SYMPTOMS

Braxton Hicks contractions
Painless, random contractions of the lower abdomen and groin, often a tightening feeling of the uterus. These are “warm-ups” to labor contractions and may occur during the 2nd and 3rd trimester. On the other hand, if you experience timeable, and/or regular contractions, try to lay down and drink fluids, and call if they do not decrease or resolve with these measures.

Leg cramps
May occur especially at night and usually in the calves. Flex your toes up towards your leg if this happens and massage the calf until it resolves. Avoid pointing your toes when stretching.

Heartburn and constipation
See 1st trimester symptoms.

Shortness of breath
Your lungs are processing more air than they did before pregnancy, which may leave you breathing slightly faster and feeling short of breath. Contact us if you experience chest pain, especially if it is localized to one side or the other.

Round ligament pain
The round ligaments support your uterus in your pelvis. As your uterus grows, the ligaments stretch and thicken to accommodate and support it. These changes can cause pain on one or both sides of the pelvis. Pain may start deep within the groin and move upward and outward towards the hips. It may also present as a dull ache after an active day. To help relieve discomfort, you may try warm baths, flexing your knees toward your abdomen, or lying on your side with a pillow under your belly. Decrease activity if necessary.

Hip pain and backaches
As pregnancy advances, the baby gains weight and puts more pressure on your back, while hormones relax the joints between your pelvic bones. Sit in chairs with good back support, apply heat and/or ice to painful areas. Contact EWHC if the pain does not go away or is accompanied by other symptoms.

Swelling
Blood return from your veins is compromised during pregnancy and fluid retention may be evident in your feet, ankles, face, and hands. Drink plenty of fluids and elevate your feet at night.

Frequent urination
Extra pressure on your bladder may cause you to urinate more often or leak urine, especially with laughing, coughing, or sneezing. Watch for signs of a bladder infection, such as burning with urination, fever, or blood in your urine, and call your health care provider if these symptoms are present.
CONTACT US IF YOU EXPERIENCE ANY OF THE FOLLOWING AT ANY TIME DURING YOUR PREGNANCY:

• Moderate to heavy vaginal bleeding or passing of tissue
• Any amount of vaginal bleeding accompanied by pain, cramping, fever, or chills
• Timeable, regular contractions unrelieved by rest and fluids
• A severe, persistent headache, especially with dizziness, faintness, nausea, vomiting, or visual disturbance
• Moderate or severe pelvic pain
• Pain with fever or bleeding
• Vomiting with pain or fever
• Chills or fever (101 degrees or higher)
Seafood Consumption in Pregnancy

Seafood is low in fat, rich in Omega 3 fatty acids, and good for your heart. However, its health benefits need to be balanced with concerns about contaminants such as mercury and PCBs.

**Seafood safe to eat 2-3 times a week:**
Anchovies, butterfish (silver pomfret), catfish, clams, cod (Pacific, Atlantic), crab (blue, king, snow, US, Canada, Russia), crayfish, flounder/sole, herring, oysters, Pollock/fish sticks, salmon (fresh, canned-chinook, chum, coho, farmed Atlantic, pink, sockeye), sardines, scallops, shrimp (US, imported), squid/calamari, tilapia, trout, tuna (canned light)

**Seafood safe to eat once a week:**
Black sea bass, Chilean sea bass, Chinook salmon (Puget Sound), croaker (white, Pacific), halibut (Pacific, Atlantic) lobster (US, Canada), mahi-mahi, monkfish, rockfish/red snapper (trawl caught), sablefish, tuna (canned white Albacore)

**Women who are pregnant or planning to become pregnant, or nursing mothers, should NOT eat the following fish:**
KING MACKEREL, SHARK, SWORDFISH, TILEFISH, TUNA STEAK (AHII)

**Serving Size**
A meal appropriate for your body size is roughly the size and thickness of your hand, or about 8 ounces uncooked (based on 160-pound adult).
*To personalize a meal size, add or subtract 1 ounce per 20 pound difference in body weight.

**Healthy Hints**
Remove visible fat before cooking
Do not eat the skin
Grill, broil or bake the fish
Let fat drip off during cooking
Don’t use fat for gravy or sauces
Eat a variety of fish
Consume younger smaller fish
If you eat more than recommended amount of fish once a month, try to eat less the next month.

*Information provided by the Washington State Department of Health*
SLEEP HABITS IN PREGNANCY

Is it safe to sleep on my back during pregnancy?
Early in the pregnancy, sleeping on your back is safe. In the third trimester (starting around 28 weeks), it is not recommended that you lie flat on your back for a prolonged period of time because the weight of your uterus presses on the major vein in your back. When you are sleeping, it is hard to control your position. If you wake up on your back, you probably awakened because your body was telling you to shift position. Some women wake up feeling dizzy, short of breath, or with heart palpitations. These symptoms should resolve quickly if you shift to either side. As your pregnancy progresses, try to sleep on one side or the other, or use a cushion to ensure that you are not completely flat on your back to avoid nighttime awakenings and ensure proper blood flow to your baby.

Is it safe to sleep on my stomach during pregnancy?
There is no problem with sleeping on your stomach in early pregnancy, as the uterus is protected by your pubic bone. As the pregnancy progresses, sleeping on your stomach will become uncomfortable, which is the cue to stop.

Is it safe to use sleeping medications during pregnancy?
Some prescription sleep aids can be used in pregnancy but should be discussed with your OB provider before starting. These medications can be habit forming, and in general, are used sparingly in pregnancy. There are over-the-counter sleep aids that are safe to use during pregnancy and are not habit forming, including Benadryl, Tylenol PM, and Unisom. These medications should be taken according to the directions on the package.

Is it safe to sleep under an electric blanket during pregnancy?
Electric blankets are safe to use in pregnancy as long as the temperature setting is not too high. In general, this means high enough to keep you warm, but not so high as to burn you or elevate your temperature. If you are concerned, you can take your temperature to make sure it is in normal range, under 100 degrees.

PREGNANCY SLEEP TIPS:
- **Drink up.** Drink plenty of fluids during the day but cut down in the evening before bedtime to minimize getting up at night.
- **Keep moving.** Exercise regularly to stay fit and improve circulation, and reduce nighttime leg cramps.
- **Get into a routine.** If you establish a soothing and comforting evening routine you’ll be able to relax and get to sleep more easily. Try a cup of caffeine-free tea or hot milk, reading, or taking a warm shower.
- **Keep heartburn at bay.** To prevent heartburn, don’t recline until 1-2 hours after a meal. If heartburn is a problem, sleep with your head elevated on pillows. Avoid spicy, acidic (such as tomato products), and fried foods as they may worsen symptoms. Safe over-the-counter medications include Tums, Mylanta, and Zantac.
- **Nap during the day.** If you’re not getting enough rest at night, take a nap to reduce fatigue. Find a quiet spot and relax, even if only for a half-hour.
- **Support your body.** Use a special pregnancy pillow or regular pillows to support your body. Try placing a pillow under your upper back or hips, or between your knees.
- **Watch your diet.** Completely eliminate caffeine if insomnia is a problem for you. If nausea is a problem, eat bland snacks throughout the day. Keeping your stomach slightly full helps keep nausea at bay. Eating a well-balanced diet, not only helps you and your baby’s health, but makes you less prone to nighttime snack attacks that contribute to restlessness and insomnia.

How much will your Counsyl screen cost?

Most people have insurance that covers Counsyl screens and the exact amount you may owe can vary based on your plan. Here’s how it works:

1. We’ll send you an e-mail with an estimate of your cost within 48 hours of you receiving your order.
2. We’ll file a claim with your insurer, who may also send you an Explanation of Benefits.
3. We’ll send you an invoice if you owe anything for your screen.

Don’t worry — this is not a bill.

Counsyl will reach out to you with your estimated cost based on your insurance provider. This test is covered by most insurance companies nationwide and if your insurance provider is in-network, your cost for the test will help you meet your in-network deductible.

If you would not like to be billed to your insurance, or if your insurance company is out-of-network and do not want to be billed to an out-of-network provider, you may choose the self-pay option which allows you to pay for the test without going through your insurance. The self-pay price is $349. Lastly, you may cancel the test by reaching out to Counsyl.

Estimate your cost
Go to counsyl.com/prices to receive an immediate estimate.

Financial assistance is available
It’s our mission to make sure anyone who needs screening can get it. We make it quick and easy to request financial assistance, and you can apply before or after getting your screen.

Live support
Our billing specialists are available to help you answer any questions you may have.

TO: Our Maternity Patients

Obstetrical fees are “global” this means that your OB care is one fee. The global fee includes office visits, the delivery of your baby and postpartum visit.

The global fee does NOT include lab work (other than routine urine screens) or ultrasounds performed during your pregnancy. These services will be charged at the time of the appointment and will be billed to your insurance company if applicable. You will be asked to pay any co-pays or deductible amount that may be applicable.

The global OB fee will not be billed until the birth of your baby. Our global obstetrical fees are:

<table>
<thead>
<tr>
<th>Service</th>
<th>Fee</th>
</tr>
</thead>
<tbody>
<tr>
<td>Normal Vaginal Delivery</td>
<td>$5167.00</td>
</tr>
<tr>
<td>Vaginal Birth after Cesarean (VBAC)</td>
<td>$5437.00</td>
</tr>
<tr>
<td>Cesarean Section</td>
<td>$5735.00</td>
</tr>
</tbody>
</table>

A cesarean section delivery requires an assistant surgeon who will also charge for services. Hospital, newborn care, and anesthesia services are NOT included in the global fee and will be billed separately. Should you have any questions regarding their fees, please contact them directly.

Anesthesia Billing: 425-451-4141
Evergreen Hospital, Financial Counselor: 425-899-3632

We will call your insurance company to confirm your medical benefits and will mail you an estimate of what your responsibility will be. Depending upon your deductible amount, you may be asked to pay a deposit which would be made in payments up to the 36th week of your care. The global fee will be billed at the time of your delivery. Whatever your insurance does not pay will be your responsibility, and we will ask for the balance due within 30 days of the insurance payment. To avoid being overwhelmed with so many bills after birth, we recommend that all patients pay their estimated amount prior to delivery.

If for any reason you need to transfer your care, or if your insurance changes mid-pregnancy, we will itemize the charges for the services provided prior to the change and bill accordingly.

If you do not have insurance coverage please contact our office at 425-285-0060 to discuss resources and/or options for payment.

Sincerely,
EvergreenHealth Obstetrics & Gynecology Care, Tan
